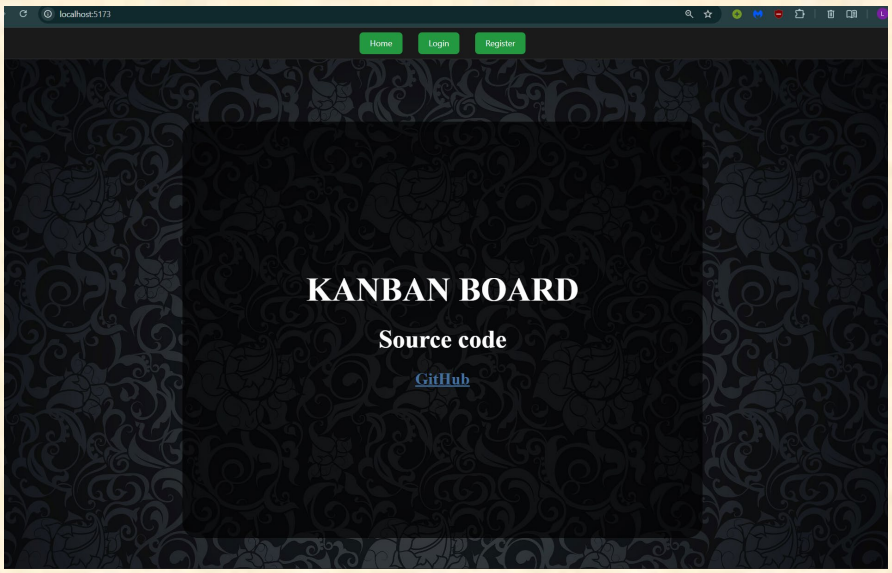
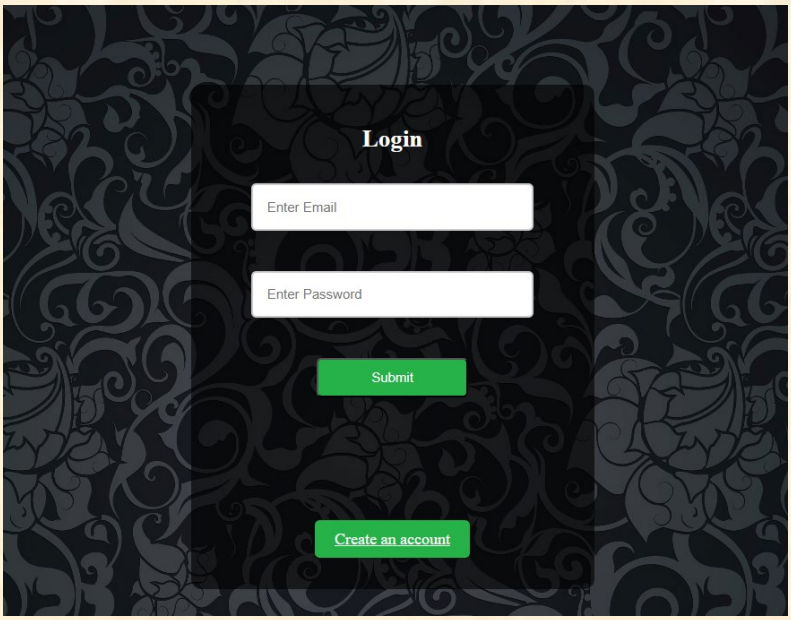
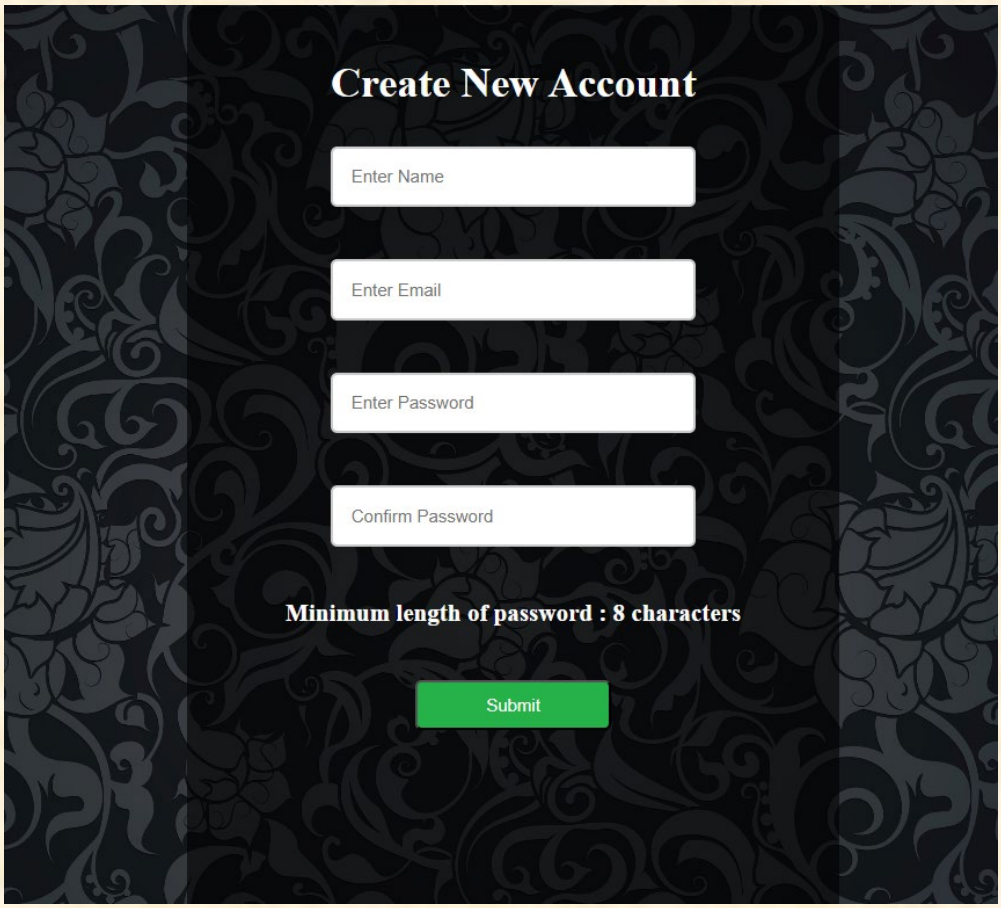
Home Page



Login Page



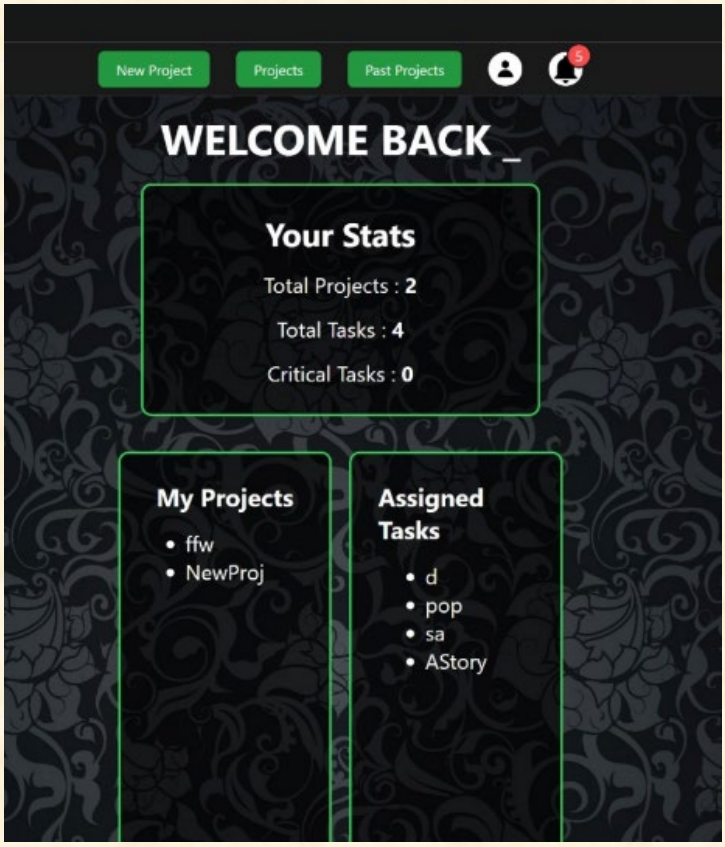
Register Page-



In the password field we have the following checks-

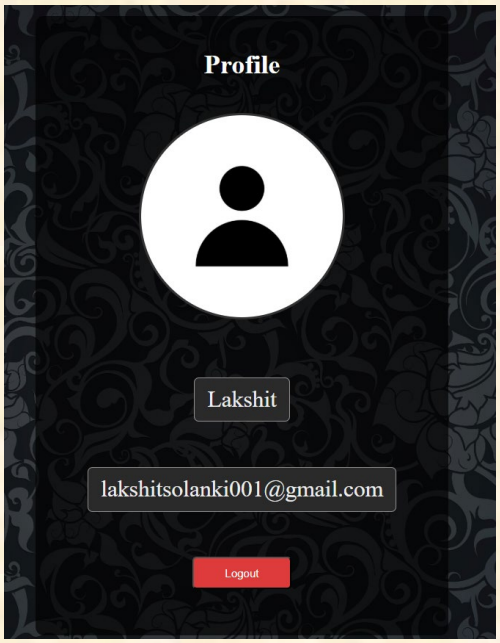
- Minimum characters are 8
- At least 1 digit
- At least 1 alphabet

Dashboard



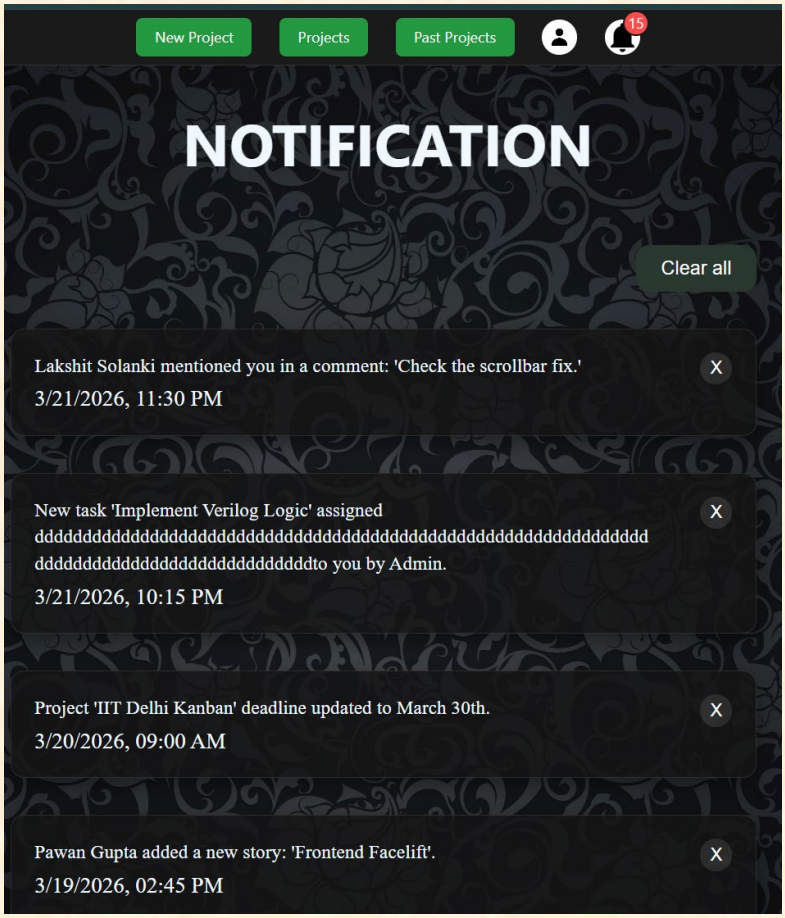
Here a list of all projects and assigned task are shown and also number of critical tasks across all projects is also shown for user attention.

Profile Page-



Here we see the user metadata and have option to change avatar and logout, by default when first registered the user will have the icon shown as the default icon, which the user can change.

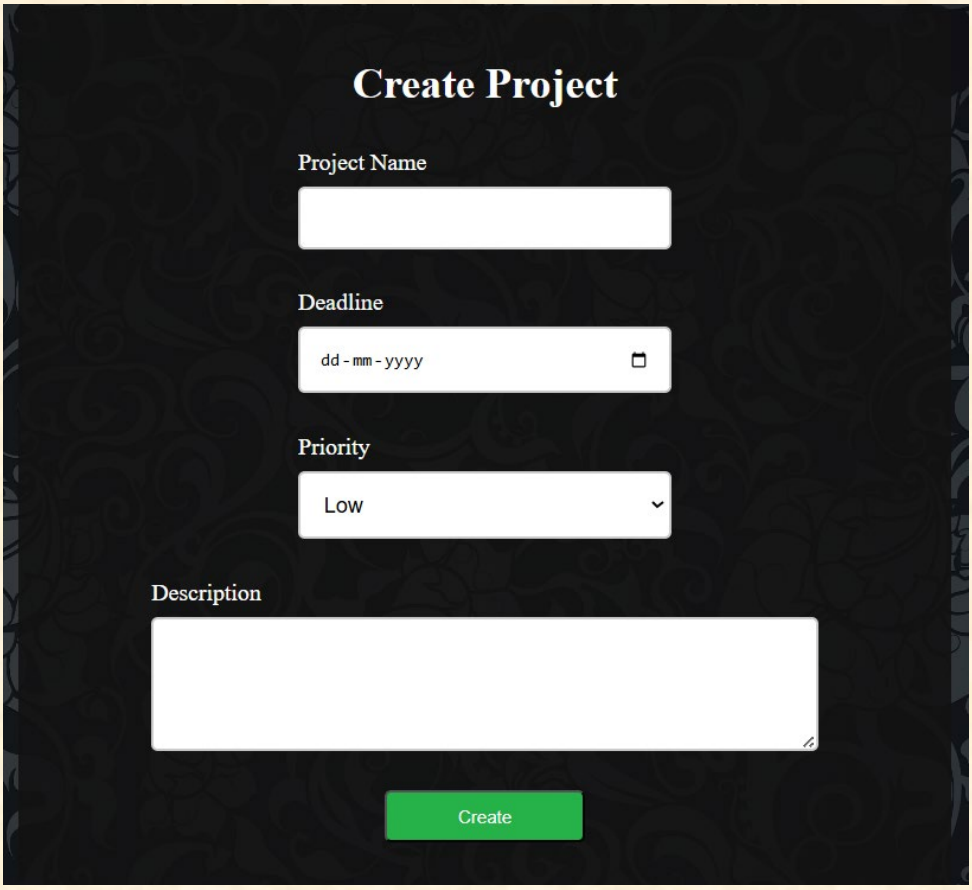
Notification Page



The clear all option will erase all the notifications and corresponding cross icon will erase individual notifications. A red icon with a number>0 will indicate the total unread notifications.

A user receives notifications if the user is been added to a project, assigned a task , any comments on his tasks and any comments mentioning the user in any tasks.

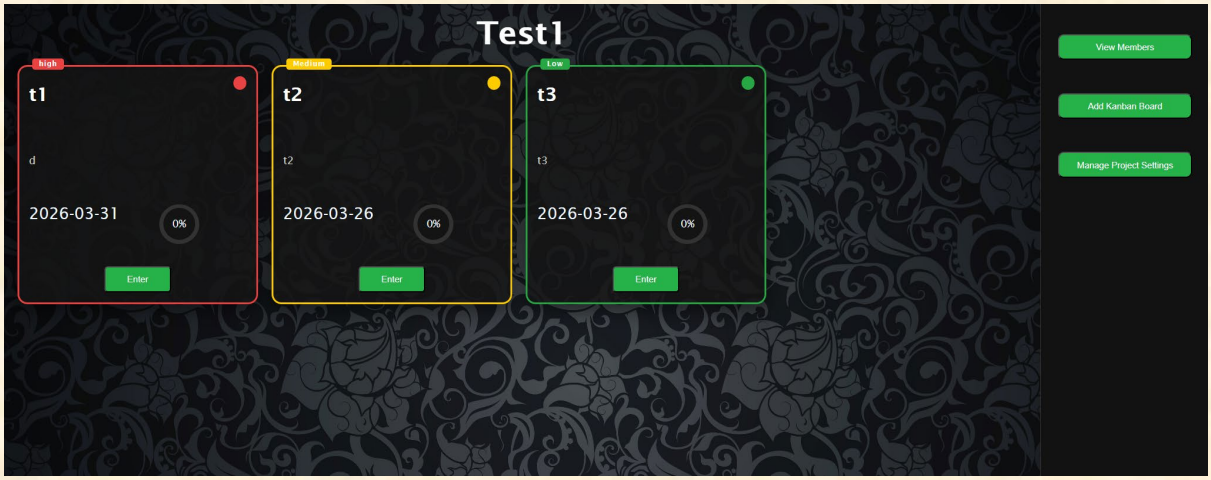
New Project-



Only visible to Global admin, can create the project by filling in the project data. Error shows if the project name or deadline is empty.

Entering description is optional

Project Dashboard-

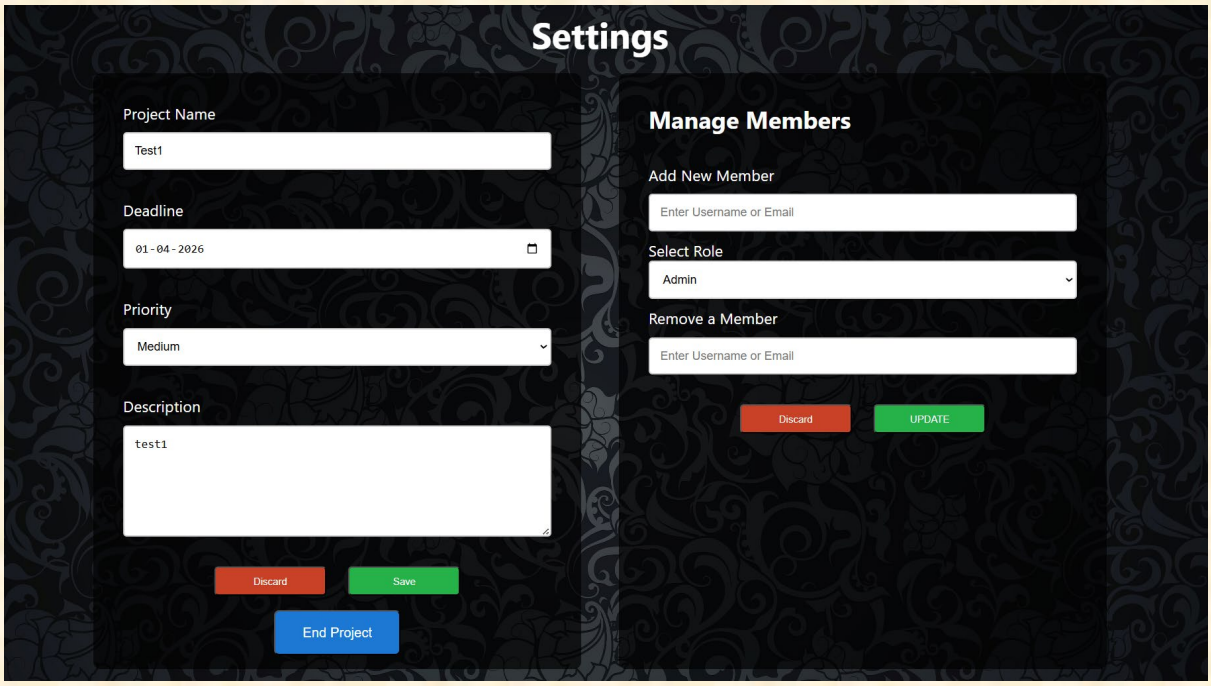


Here we have divided view screen in two parts one is main and other is sidebar. On sidebar there are three options

1. View Members (visible to all that is global admin, project admin, project member and viewer)
2. Add kanban board (visible only to global admin and project admin)
3. Project Settings (visible only to global admin)

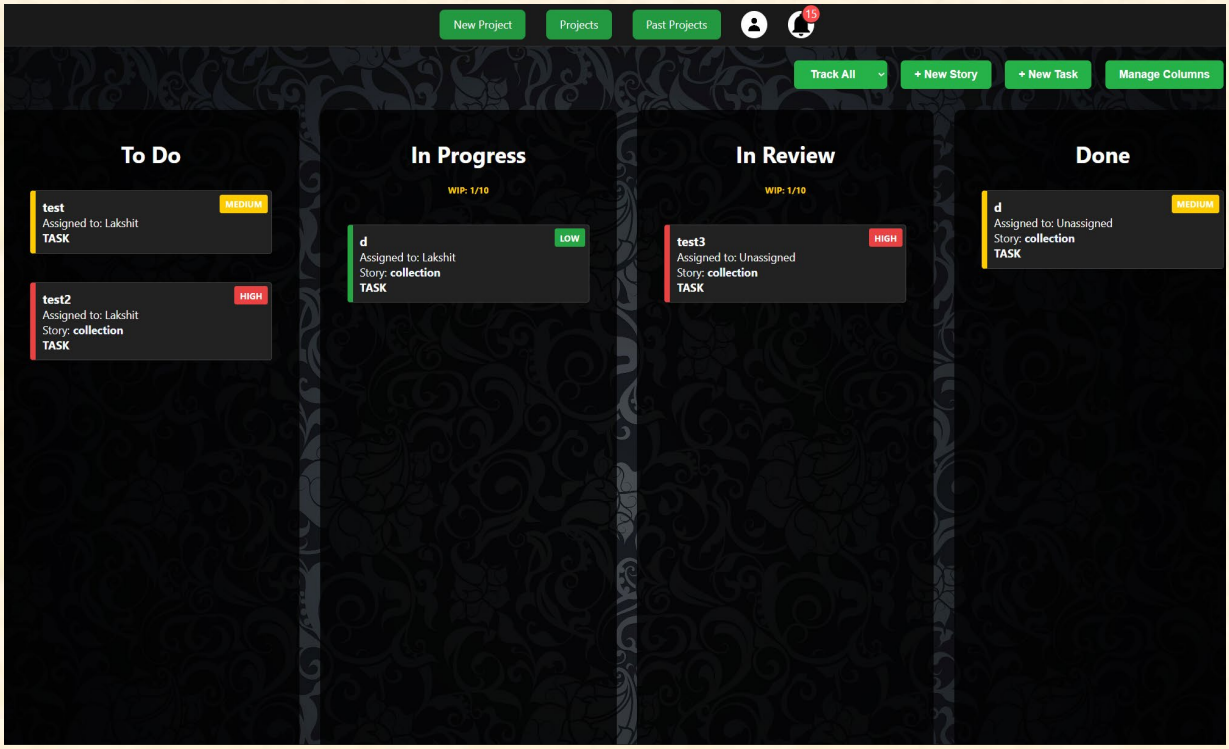
On the main screen we have our kanban board which display their meta data and also show a percentage (the logic for percentage is that it tracks the total tasks and also tracks the tasks in done column (if it exists) and then calculate the percentage).

Project Settings



Here the global admins can edit the project settings, can end the project which will move the project to past projects section and also manage members such as adding new members, selecting role and remove existing members.

Kanban Dashboard



Here by default, there are 4 columns-

1. To do (no wip limit)
2. In progress (10 wip limit)
3. In Review (10 wip limit)
4. Done (No wip limit)

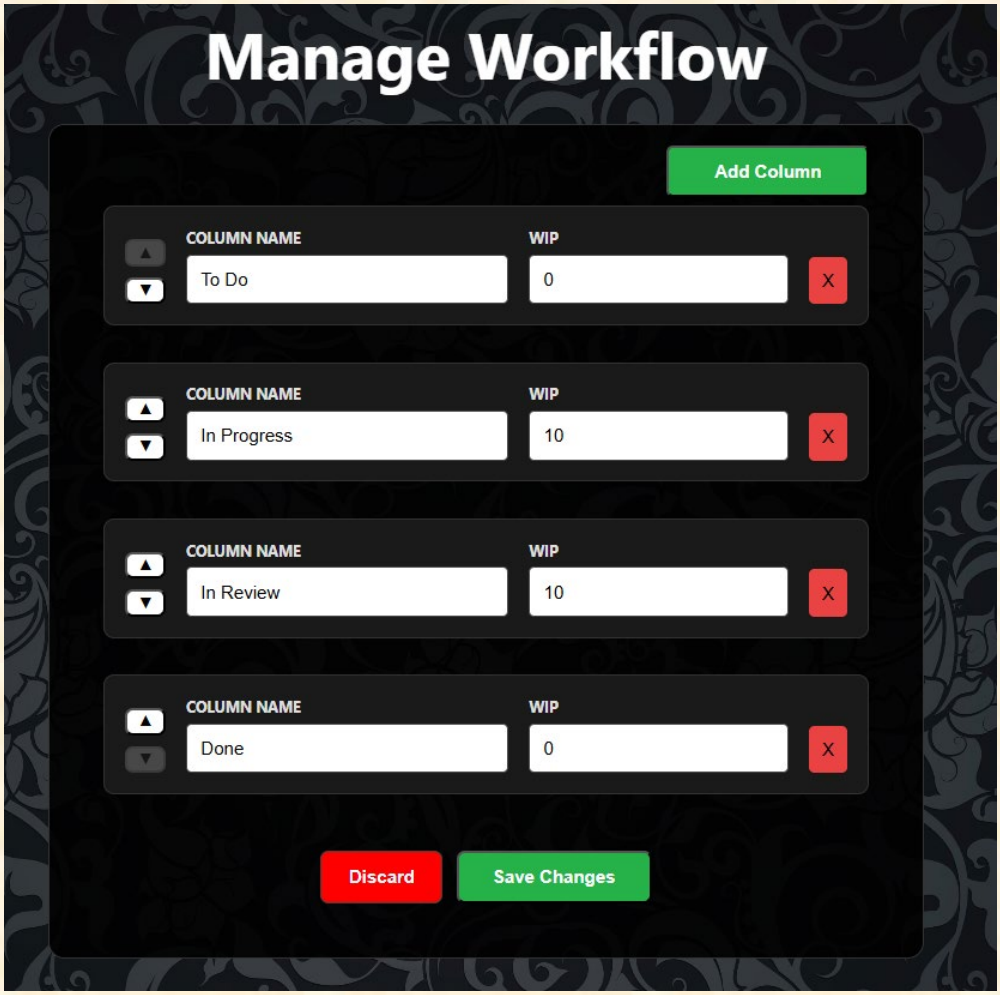
Drag and Drop functionality is added and visual feedback is provided while dragging.

The tasks metadata is shown that is their name, assignee, type and story.

There are 4 linker buttons-

1. Track- Used to track individual stories across columns (visible to all)
2. New Story (visible to global admin, project admin and members)
3. New Task (visible to global admin, project admin and members)

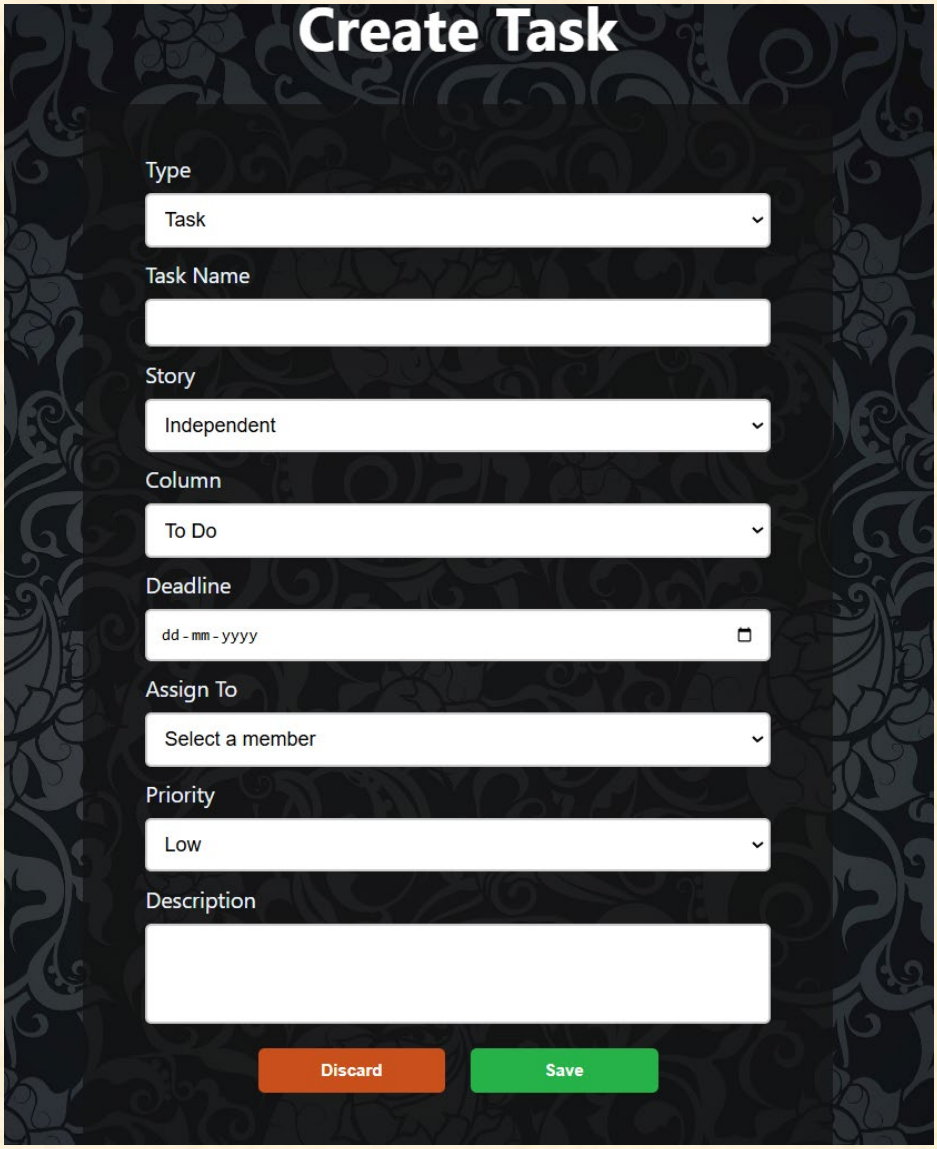
4. Manage Columns (visible only to global admin and project admin)



With the help of reorder buttons, we can reorder different workflows.

Removing a Column will lead to loss of data of tasks in that column.

Note “0” wip limit means no wip limit and unlimited tasks can be stored in the columns.



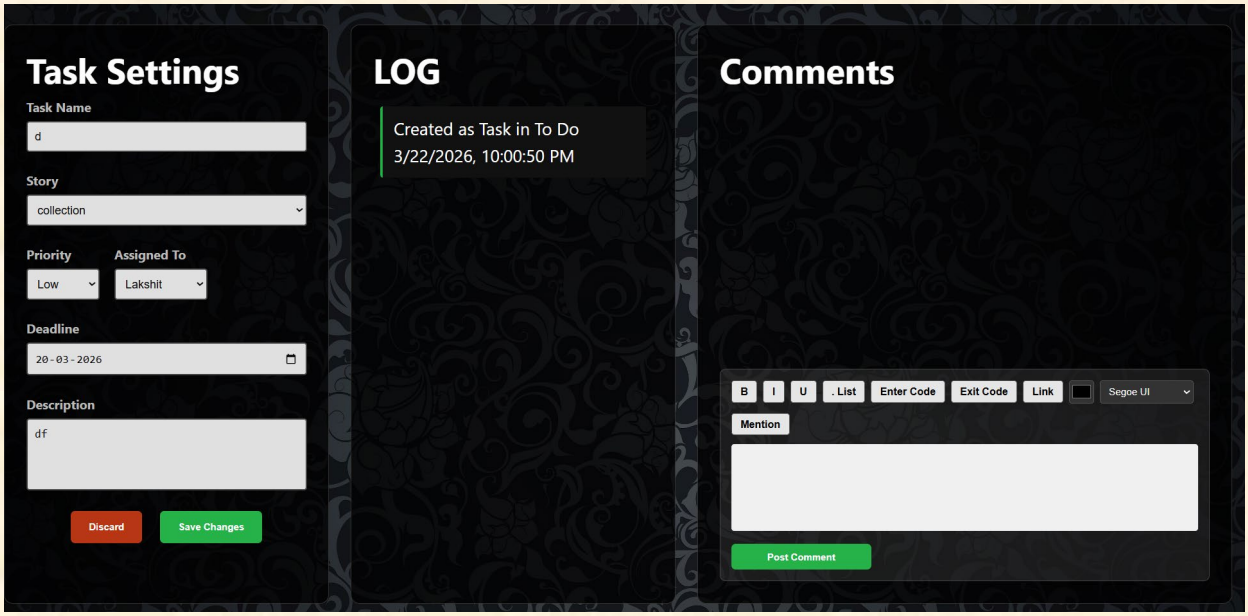
While creating new task we can choose the column and story associated with it.

We can also select the assignee which can be changed later in task settings.

Type can also be configured between the two – Task or Bug.

Story can be set as independent (no associated story) or a story can be selected from the drop down menu.

Task Settings:



This page is not accessible to viewers.

It contains three cards,

1. Task Settings: Here we can edit its assignee and other metadata and the change will be reflected in the log.
2. Log: This is the task log which updates when any metadata of tasks changes or any comments are made (as per requirements of the project)
3. Comments section- It includes features such as bold, italics, underline, unordered list, code block, hyperlink, font and color.

To use code block, press enter a code block will open in the typing area and press exit code on a newline to exit code block at that line.

Select the link in comment area and press Link to convert it into hyperlink.

Select Mention button and further select the user from the drop down to tag that user. Multiple tag in single comments are allowed.
